Perrit

Project: Complete network infrastructure

The background

Perrit, a company specializing in hosted business applications, helps organizations of all sizes develop concepts for IT systems and implement those solutions.

The building Perrit occupied was out of date, and needed to be rebuilt. In addition to adding a floor on the top of the building, the company also renovated the front of the building and the outside walls.

During the reconstruction work, the company's staff had to move temporarily to another location in the city. Because of the move, Perrit looked for a vendor that could take care of the company's network infrastructure during and after the rebuilding.

The solution

After searching the Internet and getting third-party recommendations, Perrit came to Black Box for advice. After consultations, Black Box came up with a solution, which included the complete design and installation of a new server room.

During the reconstruction, the relocated staff worked via connections to the server room in the rebuilt basement of the original office building. Black Box also provided the complete network infrastructure cabling for the building.

"The collaboration with Black Box went very well. We received good advice in advance on the speed of the network and the quantity of cables in the patch boxes. The cabling is uncluttered and looks neat and tidy, and works perfectly. We are currently in negotiation about new assignments."

Mr. J. van Wieringen, Account Manager, Perrit
